# Weekly Coal Production

Production for Week Ended:  
February 24, 1990

## Preface

The *Weekly Coal Production (WCP)* provides weekly production estimates of U.S. coal by State, as well as supplementary data which are usually published twice a month. The Coal Exports and Imports Supplement contains annual as well as detailed monthly data on U.S. coal and coke exports and imports. Another supplement contains detailed monthly data covering electric utility coal consumption, stocks, and receipts (quantity and price).

Preliminary actual data are published quarterly, based on the Form EIA-6 coal distribution data. The estimation error for a quarter at the national level ranges from 1 percent to 4 percent. The State-level errors can vary slightly from the national level.

Final data are published annually, based on the Form EIA-7A Coal Production Survey. The revision error for a quarter at the national level ranges from 0.02 percent to 0.08 percent. The State-level errors can vary slightly from the national level.

This publication is prepared by the Coal Division; Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA) to fulfill its data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (P.L. 93-275) as amended. *Weekly Coal Production* is intended for use by industry, press, State and local governments, and consumers. Other publications that may be of interest are the quarterly *Coal Distribution Report*, the *Quarterly Coal Report*, *Coal Production 1988*, and *Coal Data: A Reference*.

This publication was prepared by Wayne M. Watson under the direction of Mary K. Paull and Noel C. Balthasar, Chief, Data Systems Branch. Specific information about the *State Coal Profile: Colorado* may be obtained from Chris V. Buckner at 202/254-5368. Questions on energy statistics should be directed to the National Energy Information Center (NEIC) at 202/586-8800.

## Summary

U.S. coal production in the week ended February 24, 1990, as estimated by the Energy Information Administration, totaled 20 million short tons, approximately the same as in the previous week. This was 4

percent higher than in the comparable week of 1989. Production East of the Mississippi River totaled 12 million short tons, and production West of the Mississippi River totaled 8 million short tons.

## State Coal Profile: Colorado

### Total Area of State:

104,247 square miles

### Area Underlain by Coal:

29,600 square miles

### Demonstrated Reserve Base of Coal:

17 billion short tons  
(January 1, 1989)  
(4 percent of U.S. total)

### First Year of Documented Coal Production:

1864 (500 short tons)

### Peak Year of Coal Production:

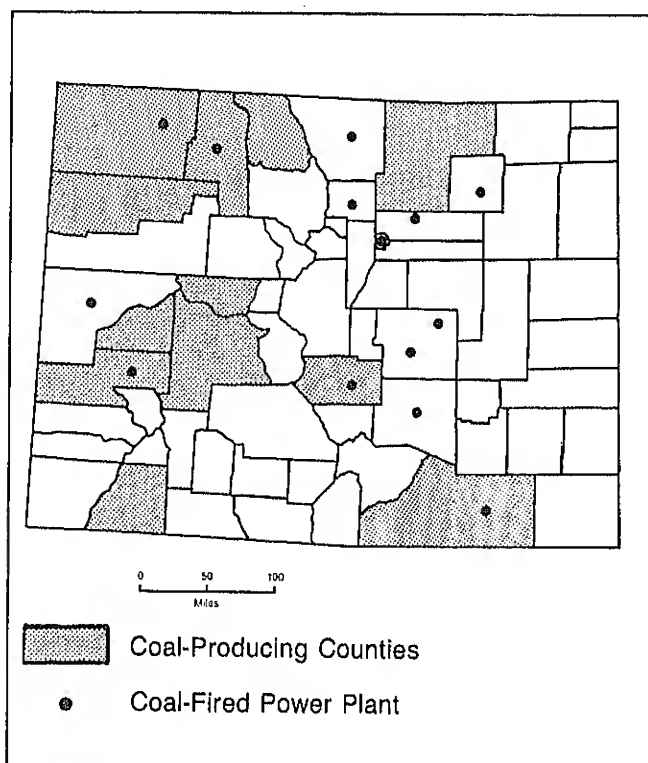

1981 (20 million short tons)

### 1988 Coal Production:

16 million short tons  
(1.7 percent of U.S. total)

### 1988 f.o.b. Average Mine Price

\$23.09 per short ton  
(U.S. average = \$22.07)

	<u>Number</u>	<u>Percentage of U.S. Total</u>
<b>Number of Mines (1988)</b> .....	23	<1
Underground .....	15	<1
Surface .....	8	<1
<b>Number of Miners (1988)</b> (at mines producing more than 10,000 short tons) .....	2,103	2
Underground .....	1,424	3
Surface .....	679	1
<b>Average Quality of Utility Coal Receipts (1988)</b>	<u>Colorado</u>	<u>U.S. Average</u>
Heat Content (million Btu per short ton) .....	19.5	20.9
Sulfur Content (percent) .....	0.4	1.3
Ash Content (percent) .....	7.0	9.9

Coal occurs in scattered regions throughout Colorado. Bituminous coal accounts for one-half of the demonstrated reserve base, with the balance comprised of nearly equal amounts of subbituminous coal and lignite and a very small amount of anthracite.

Coal was mined commercially in the Denver region in the early 1860's. Production rose to about 12 million short tons in 1917, declined during the Depression years, and reached a low of about 3 million short tons in 1954. The decline reflected the increased use of natural gas and the replacement of coal-burning trains with diesel-powered locomotives. Since the 1960's, Colorado coal has been on a steady rise, largely due to the production of high-quality coking coal and the opening of large mines to produce low-sulfur coal for electric utilities.

Colorado produced 16 million short tons of coal in 1988, with a value of production estimated at nearly \$370 million, representing more than 20 percent of the total value of mineral production in the State. About 60 percent of the total production was from Federal lands. Royalties from coal production on Federal lands in fiscal year 1988 were \$14 million, half of which goes to the State of Colorado. Over 60 percent of Colorado's current coal production is surface-mined, with Mofatt and Routt Counties accounting for most of this production. Surface mining productivity was noticeably below the Western Region average, reflecting the difficulty of surface mining in the Colorado Rockies. In 1989, six longwall systems were active in Colorado's underground mines, the largest number among the Western States and the sixth largest State level overall.

For many years Colorado was a leading producer of coking coal, with two of the four major coking-coal fields in the West located in the State. Since 1983, when the State's only iron and steel operation, Colorado Fuel and Iron Steel Corporation in Pueblo closed, Colorado has not consumed any coking coal. Since then, all of the coking coal mined in Colorado has been shipped to Utah.

1988, Colorado consumed 16 million short tons of coal, with over 60 percent being mined within the State. With 14 coal-fired electrical generating plants located in the State, electric power plants account for 95 percent of coal consumption. Most of the remaining demand, accounting for 38 percent of the State's total production, came from Arizona, Texas, and Utah. The coal-fired generating plants have a net capability of 4,965 megawatts, comprising 70 percent of the generating capability in the State. The units generated 28 billion kilowatthours of coal-fired electricity, 90 percent of the production for the State. Of the

*A hydraulic excavator loading coal at one of Colorado's eight surface coal mines.*

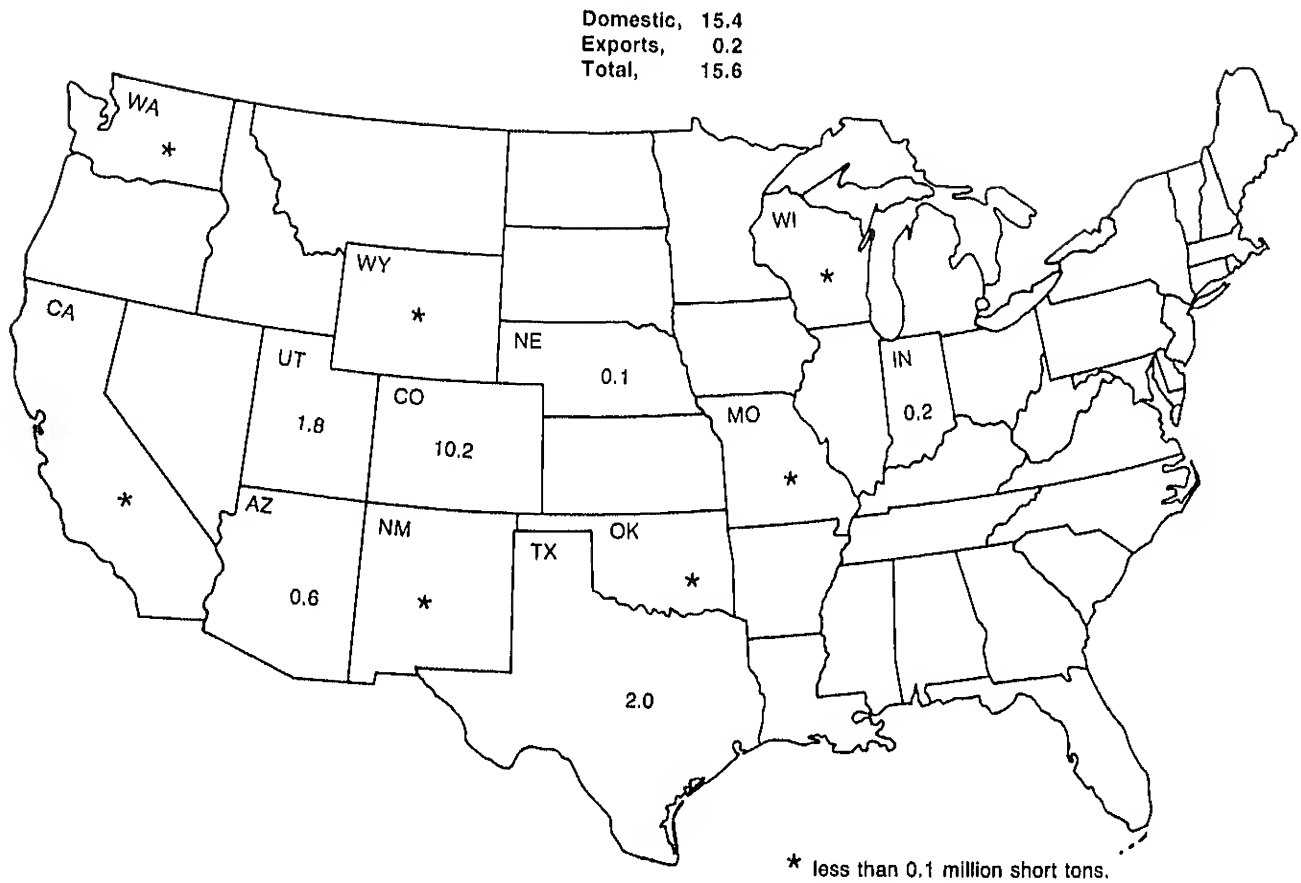

coal used in other sectors, cement plants and sugar refining were the largest consumers.

Looking ahead, coal production in Colorado is expected to average 17 million short tons through 1991. Coalbed methane, which is being produced in Colorado, has become a potential energy source. The State is one of the most active areas of coalbed methane development in the West. In the continued outlook for Colorado coal, a rising demand for low-sulfur coal for power generating units and for industrial purposes assures a steady demand for the Colorado coal industry.

# —“An investment in knowledge pays the best interest.”—

Your Government has published thousands of books to serve America. And now the Government Printing Office has put together a catalog of the Government's "Bestsellers"—almost a thousand books in all. Books like *The Space Shuttle at Work*, *Starting a Business*, *U.S. Postage Stamps*, and *National Parks Guide and Map*. I daresay there's even information on one of my favorite subjects—printing.

Find out what the Government has published for you—send for your free catalog. Write—

# NOT FOR SALE

## BECAUSE IT'S FREE!

Every year the Government publishes thousands of books. And every year the U.S. Government Printing Office sells these books to the public. Now there's a book that tells you about the Government's new and popular publications—but it's not for sale . . . it's *free*!

It's our catalog of books—hundreds of books from virtually every Government agency. The subjects range from agriculture, business, children, and diet to science, space, transportation, and vacations. And there are titles on military history, education, hobbies, physical fitness, gardening, and much, much more! There's also a special section for recently published books.

Find out about the Government's new and popular books by sending today for a copy of the book we *don't* sell. Write—
